Application No. 08/776,044

- a) determining a nucleotide sequence of the complete coding region of a cancer-related p53 protein from genomic DNA or cDNA derived from a human neoplastic tissue or body fluid;
- b) analyzing the nucleotide sequence determined in step a) for the presence of mutations; and
- c) classifying the neoplasia into different subgroups depending on
 - (i) the presente or absence of a mutation, and
 - (ii) whether the patient is node positive or not; and
- d) using the results of steps c)(i) and c(ii) in combination for prognosticating the development of the neoplasia and providing guidance for the treatment of the patient.

14. (Amended) A method for prognostication of the development of neoplasia in a human patient having a neoplasia comprising:

- a) determining the nucleotide sequence of the complete coding region of a cancer-related p53 protein from genomic DNA or cDNA derived from a human neoplastic tissue or body fluid;
- b) analyzing the nucleotide sequence determined in step a) for the presence of mutations, and

- c) classifying the neoplasia into different subgroups depending on
 - (i) the presence or absence of a mutation, and
- (ii) whether the patient is node positive or not; and
 d) using the results of steps c)(i) and c(ii) in
 combination for prognosticating the development of the
 neoplasia.
- 15. (Amended) A method for prognostication of the development of neoplasia in a human patient having a neoplasia comprising:
 - a) determining the nucleotide sequence of the complete coding region of a cancer-related p53 protein from genomic DNA or cDNA derived from a human neoplastic tissue or body fluid;
 - b) analyzing the nucleotide sequence determined in step a) for the presence of mutations; and
 - c) classifying the neoplasia into different subgroups depending on the presence or absence of a mutation; and
 - d) using the results of steps c) for prognosticating the development of the neoplasia.
